Chapter 1
Introduction: Principles of Psychology

The Wages of Fear 3

1.1 Psychology’s Roots 4
Our ancestors had to pay attention to the behavior of people and other animals 4
Early philosophers wrestled with questions about knowledge and reality 5
Darwin taught us that there is a continuum of behavior from animals to humans 7

1.2 The Rise of Empiricism 9
German thinkers brought keen observation and structure to psychology 9
William James emphasized functionalism and the “brain as machine” 10
Behaviorism revealed the rules of learning, but only a limited understanding of behavior 11
Modern psychology is a cognitive science that discerns processes in the machine at work 13
Neuroscience aims to explore the brain and its workings directly, peering inside the “black box” 14
Like most scientific fields, psychology long excluded women and minorities 16

1.3 Psychological Myths and Four Principles of Psychology 19
Despite great progress, many psychological myths endure 19
Think like a psychologist: There are four important principles to consider for any behavior 22

RESEARCHERS AT WORK: Detecting racial associations with crime 23

Chapter 2
Psychology as a Science 29

Are Women Musicians Inferior? 29

2.1 What Constitutes a Science? 30
Science begins with the careful observation of phenomena 31

© 2015 Sinauer Associates, Inc. This material cannot be copied, reproduced, manufactured or disseminated in any form without express written permission from the publisher.
Chapter 3
The Neuroscience of Behavior 63

3.1 The Structure of The Nervous System: A Microscopic View 64
The brain contains billions of neurons, or nerve cells 65
Neurons communicate with each other at synapses 66
Neurotransmitters transfer information across synapses 66
We can classify neurons into three functional types 68
Psychology in Everyday Life: Dualism and Descartes’s Error 71

3.2 The Nervous System at Work: The Body Electric 72
Every cell in your body is a tiny battery 73
Neurons use electrical signals to summarize information from many synapses 74
Synaptic input determines whether a neuron will produce an action potential 75
Once begun, action potentials travel down the axon 76
Action potentials work like a flushing toilet 77
Myelin speeds up action potentials 78
What happens when the action potential reaches the end of an axon? 80

3.3 Understanding The Nervous System: Divide and Conquer 85
The central nervous system gathers information and makes the big decisions 87
The cerebral surface is divided into lobes 89
Beneath the surface of the cerebral cortex are orderly clusters of cells 92
Each side of the brain controls the opposite side of the body 93
The peripheral nervous system carries information between the body and the central nervous system 93
The autonomic nervous system is out of our control 94

3.4 How We Study the Brain 96
Lesions and electrical stimulation can map brain functions 97
Scientists can eavesdrop on electrical signals within the brain 98
Today’s imaging technology reveals the brain’s interior structure and function 99
We infer brain function by comparing different mental activities 101

Drugs affect brain signals and therefore the mind 82
Hormones affect the brain too 83
Chapter 4

Genes, Environment, and Behavior 109

Non-Identical Identical Sisters 109

4.1 Genes at Work 111
The genes we inherit provide "recipes" for making proteins 111
Our mother and father give us slightly different "recipes" for each protein 113
If we get a nonfunctional allele from one parent, the other allele usually spares us from harm 114

Psychology in Everyday Life: Natural Selection Favors Beneficial Alleles 115
We can see how dominant and recessive alleles work in pea plants 116

4.2 The Regulation of Genes 118
Different genes are used at different times in different cells 118
Sensory experience and learning affect gene expression 120
Genes and experience interact 121

RESEARCHERS AT WORK: Mothers matter 121

4.3 Single Gene Effects on Behavior 124
Genes that severely disrupt brain function have a strong, direct, and disastrous effect on behavior 124
Genes that affect sensory systems can have a strong effect on behavior 127

Skeptic at Large: Controlled by Our Genes? 129

4.4 Multiple Gene Effects on Behavior 130
Twin studies confirm a genetic contribution to schizophrenia 130
What does it mean if a behavior is "heritable"? 132
There are several things that heritability does not mean 132
Inferences about heritability from twin studies make several simplifying assumptions 133
Although rare, cases of identical twins who are reared apart offer powerful insights 134

4.5 The Interaction of Genes and Experience 135
Stress plays a role in the appearance of schizophrenia 135
Genes and the environment constantly interact to affect our behaviors 136

THE CUTTING EDGE: Early Experience
Epigenetically Affects the Stress Response in Adulthood 138

Chapter 5

Developmental Psychology 143

Growing Up Alone 143

5.1 The Developing Brain 144
There are six stages of neural development 145
Experience guides brain development 148

5.2 The Developing Mind 150
Developmental stages can be seen in motor and sensory development 150

Psychologists have learned how to read babies’ minds 154

RESEARCHERS AT WORK: Habituation tests help researchers understand vision in infants 155
Memory develops steadily during infancy 157

Skeptic at Large: Attention Deficit Hyperactivity Disorder 159
Piaget studied the stages of cognitive development 160

**Psychology in Everyday Life:** Autism Is a Difficulty in Reading Other People’s Minds 163

Proper emotional and social development requires a warm, interactive adult 165

Scientists study love and attachment 166

**Psychology in Everyday Life:** What Are the Effects of Day Care on Children? 171

5.3 Adolescence: Developing Identity 173

Adolescence is marked by physical changes that prepare boys and girls for adulthood 173

Adolescence can be a confusing and troubling time 176

We must learn to balance pleasing other people and defying them 178

5.4 Adulthood and Beyond 180

Erikson identified eight stages in the development of our relationships with others 181

The aging mind slows down but continues to grow 183

**THE CUTTING EDGE:** If We Are Lucky, We Face Aging and the Possibility of Alzheimer’s Disease 187

---

**Chapter 6**

**Sensation and Perception** 193

No Pain, No Gain 193

6.1 Sensory System Principles 194

Sensation begins with a stimulus 194

All detection systems have thresholds 196

Psychophysics systematically analyzes perception 198

Detection involves finding a signal in a background of noise 200

A stimulus that doesn’t change is unimportant, so sensory systems ignore it 202

6.2 Touch and Pain 203

Our nerves provide information about a specific type of stimulation 204

Touch perception is more refined than you might think 205

Different receptor cells have different receptive fields 205

Painlessness is hazardous to your health 207

**RESEARCHERS AT WORK:** Specialized receptors transmit information about pain 208

Pain illustrates the vast difference between sensation and perception 209

6.3 Vision 211

Reflected light arrives on the retina 211

We all have our blind spots 213

Divide and conquer: How visual information reaches the two hemispheres of the brain 214

**Skeptic at Large:** How Does a Flower Look to a Bee? 215

Having two eyes helps bring us the world in 3D 217

Our eyes adjust to massive changes in light intensity 221

What is the physical nature of color? 223

Color is constructed by the brain 224

The visual system uses shortcuts to provide nearly instantaneous perception 226

The visual system organizes perceptions of groups of objects 229

6.4 Hearing 231

Sound is a pattern of pressure in the air (or water) 231

The outer and middle ears funnel sound to the cochlea 232

The cochlea detects the various frequencies of sound 234

The cochlea picks up good vibrations (and bad) 235

How do we know where a sound is coming from? 235

6.5 Taste and Smell 237

Our nose and tongue are exquisitely sensitive chemical detectors 237

Five taste receptors contribute to flavor 237

Thousands of different odor receptors bring us the richness of flavor 240

**THE CUTTING EDGE:** Bionic Eyes 241
Chapter 7

Consciousness 247

Uncontrollable Sleep 247

7.1 Consciousness 248

It is difficult to assess consciousness 248
The brain’s activity is similar whether we imagine something or actually see it 251
What is the function of consciousness? 251
Split-brain patients offer clues about consciousness without language 253
In split-brain patients, the verbal mind tries to explain what the other mind is doing 255
We are not always aware of what our brain has decided to do 256

RESEARCHERS AT WORK: Who’s in charge here? 257

Skeptic at Large: Is Free Will Illusory? 259

7.2 Sleep and Dreams 260

Biological rhythms enforce a sleep–wake cycle 261
There are two different categories of sleep 263
Do animals dream? 268
At least four brain regions regulate sleep states 269

RESEARCHERS AT WORK: Divide and conquer 269

We need sleep, but why? 272
Sleep deprivation has relatively mild effects, yet total sleep deprivation is fatal 274

Sleep disorders can have mild effects or be devastating 277
Sleep patterns change across the life span 279

7.3 Hypnosis and Meditation 281

Hypnosis is not what it’s cracked up to be 282
People vary in their susceptibility to hypnosis 283
Hypnosis can reduce pain 284

RESEARCHERS AT WORK: Talking away the pain 284

Hypnosis does not improve memory 286
What is the boundary between being accommodating and being entranced? 288
Meditation resembles self-hypnosis 290

7.4 Psychoactive Drugs 291

Psychoactive drugs affect the mind by acting on neurotransmitter systems 292
Drugs can be classified by their general effects on mental activity 293

Psychology in Everyday Life: Has the Legal Model of Drug Control Been Effective? 298
Addiction involves physical and psychological dependence 299

THE CUTTING EDGE: Marijuana Is Risky for Teenagers 302

Chapter 8

Learning 307

Afraid of Santa Claus 307

8.1 Predicting the Future 308

The simplest learning tasks involve only one cue 309
Classical conditioning teaches us to anticipate the future 311
Subjects in classical conditioning learn about more than just the conditioned stimulus 314
Our everyday behavior reflects what we’ve learned by classical conditioning 315
Taste aversion proved the relevance of evolution to conditioning 316

RESEARCHERS AT WORK: Some associations are made more readily than others 316

Psychology in Everyday Life: Taste Aversion Saves Lives 319
Fear conditioning is a type of classical conditioning using a painful unconditioned stimulus 319

8.2 Reinforcing Behavior 322

Live and learn: Thorndike’s law of effect 322
Everyone likes to be rewarded 325

Skeptic at Large: Operant Conditioning for Fun and Profit 326

© 2015 Sinauer Associates, Inc. This material cannot be copied, reproduced, manufactured or disseminated in any form without express written permission from the publisher.
Reinforcement and punishment can be positive or negative 328
Punishment can be counterproductive 329
Active avoidance is especially resistant to extinction 330
The pace of rewards affects how quickly and well we learn 332

8.3 Observational Learning 337
Does a rat in a maze become lost in thought? 337

Chapter 9
Memory 351
Trapped in the Eternal Now 351

9.1 The Stages of Memory Formation 352
We retain raw sensory information for only a few seconds 352
Skeptic at Large: Does Anyone Have Photographic Memory? 353
RESEARCHERS AT WORK: How to retrieve fading images 354
Short-term memory is brief, but can be extended if we work with the information 355
Long-term memories also fade unless they are used 357
Short-term memory and long-term memory rely on different processes 358
We have to encode information in order to store and retrieve it 360
Some short-term memories are consolidated into the vast store of long-term memory 363
Psychology in Everyday Life: A Few People Have Prodigious Memories 364

9.2 The Vulnerability of Memory 366
Sometimes one memory can interfere with another 367
Several psychological phenomena indicate that forgetting is probably due to a failure in retrieval 369
Memory is susceptible to distortion 371

RESEARCHERS AT WORK: Latent learning 338
“You can observe a lot by watching” 340
Social learning profoundly shapes human behavior 342
Sometimes insight plays a role in learning 344

What Ever Happened to Little Albert? 345

9.3 Different Forms of Long-term Memory 378
There are different types of amnesia 378
The hippocampus is required to put some memories into LTM elsewhere in the brain 379
RESEARCHERS AT WORK: Henry was able to form new memories for some tasks 380
People with Korsakoff’s syndrome, like H.M., have trouble forming new declarative memories 382
Brain damage can destroy autobiographical memories while sparing general memories 382
Skeptic at Large: Amnesia in Real Life Is Not Like It Is in the Movies 384
Different forms of nondeclarative memory serve varying functions 385
What is the physical basis of memory? 385
Long-term potentiation (LTP) may provide a physical basis for memory 387
THE CUTTING EDGE: Are There Some Things We Should Forget? 391
Chapter 10
Language and Cognition 397

Unheeded Warnings 397

10.1 Language 398
What are the components of human language? 398
Animal communication reveals the evolutionary roots of language 400
Can other animals acquire language with training? 402
We start life ready to decode any language we happen to hear 404
Psychologists use behavior to test babies’ language ability 405
RESEARCHERS AT WORK: “Reading babies’ minds” 406
Psychology in Everyday Life: Williams Syndrome Offers Clues about Language 408
There are sensitive periods for learning a language 409
Some people have a harder time learning to read 410
For most people, the left hemisphere of the brain controls language 411
Psychology in Everyday Life: The Comparatively Minor Effects of Childhood Loss of a Cerebral Hemisphere 414
What is the right cerebral hemisphere for? 414
Language and culture can influence our thought processes 416

10.2 Deconstructing Mental Processes 419
There are two kinds of people, and both of them categorize 420
Mental processes take time 421
We reproduce images and manipulate them in our mind 423
RESEARCHERS AT WORK: We need time to move mental images 423
There are at least three stages in acquiring a skill 425
Skeptic at Large: Is There Such a Thing as Subliminal Perception? 428
Attention is the spotlight of the mind 429
Even a brief break in our attention can make us “blind” 432

10.3 Decision Making and Problem Solving 434
Every judgment is subject to error and bias 435
RESEARCHERS AT WORK: Even random information can induce bias 436
We are all prone to particular errors of judgment 437
Our hindsight seems so good because our memory is so easily distorted 439
We hate loss more than we love gain 441
Problem solving involves algorithms, heuristics, and representations 443
Strategies may help or impede problem solving 444
THE CUTTING EDGE: Defending Preferences You Never Made 446

Chapter 11
Intelligence 451

The Admirable Crichton 451

11.1 History and Development of Intelligence Tests 452
Intelligence tests were first created to make a more ordered society 452
How are intelligence tests administered? 455
Modern-day IQ scores compare individuals of the same age group 455
Intelligence test scores are normally distributed 457
A reliable psychological test provides consistent results 459
Establishing test validity is more difficult 461
What do IQ scores “predict”? 463

11.2 The Many Facets of Intelligence 469
Is there any such thing as general intelligence? 469
Newer models emphasize “intelligences” 472
A wide variety of developmental disorders result in intellectual disability 474
A few people are remarkably gifted at specific mental abilities 476
Intelligence, and intelligence scores, can change over the life span 478
Does IQ decline with age? 479

11.3 The Controversy over Group Differences in IQ 481
How do we measure the heritability of IQ? 481
Just because IQ is heritable doesn’t mean it can’t be changed 482
Skeptic at Large: Class Bias Is Found in Most IQ Tests 483
Heritability does not mean what most people think it does 484

12.3 Sexual Behavior 520
In non-human animals, sexual behaviors are stereotyped and closely regulated by hormones 520
In humans, sexual behavior is neither as stereotyped nor as hormonally regulated as in animals 522
Prenatal hormones shape the sex of the body in humans and other mammals 527
Psychology in Everyday Life: Why Aren’t There More Women Scientists and Engineers? 529
Testicular steroids masculinize the developing brain of animals and perhaps of humans 531
Sexual orientation is a complex behavior that in humans appears to be affected by prenatal hormones 534
Nature seems to have some influence on sexual orientation 536

12.4 Social Motivation 539
Everyone feels the need to belong 540
Industrial and organizational psychology is the study of the behavior and attitudes of people in workplaces and organizations 541

THE CUTTING EDGE: Distracted by Food 543
Chapter 13  
Emotions, Stress, and Health 549

The Stresses and Strains of Baboon Life 549

13.1 Emotions 550
What is the relationship between emotional experience and the body’s physiological reactions? 550
Manipulating sympathetic arousal gives rise to the two-factor theory of emotional experience 552
RESEARCHERS AT WORK: Arousing emotions 552
How many different emotions are there? 554
Skeptic at Large: Why Do We Yawn? 556
The ancient theory of emotional catharsis is not supported by modern research 559
The pursuit of happiness 561
A specialized brain circuit underlies the adaptive experience called fear 564
Affective neuroscience is revealing brain circuits for emotion 566
Psychology in Everyday Life: Posttraumatic Stress Disorder (PTSD) 567
The left and right sides of the brain differ in emotional processing 569

13.2 Stress and Health 571
Psychology in Everyday Life: “Lie Detector Tests” Detect Stress, not Lies 572
The physiology of the stress response is similar across all mammals 573
Not everyone responds to stress the same way 575
Lack of control and unpredictability make unpleasant events even more stressful 576
RESEARCHERS AT WORK: The value of control and predictability 577
Health psychology explores the relationship between physical and mental health 579
There is constant communication between the nervous system and the immune system 580
We are simply not adapted to handle prolonged stress 582
What are some strategies for dealing with stress? 583
Healthy living helps combat stress 585
Psychology in Everyday Life: How to Stop Smoking 588
Friends and family provide us with a buffer from the cruel, cruel world 589
THE CUTTING EDGE: Fearless Parasites Manipulate Their Hosts 591

Chapter 14  
Personality 597

An Explosive Personality 597

14.1 The Quest for Personality 598
There is a long history of ideas about personality 598
Skeptic at Large: Your Horoscope Today Says… 600
Freud focused on the unconscious 600
Freud believed family dynamics during development affected personality 603
Skeptic at Large: Does Birth Order Affect Personality? 606
Freudians probe the unconscious to reveal conflicts in a client’s personality 606
Projective tests are unreliable and their validity is difficult to determine 608

14.2 The Rejection of Personality Types and the Pursuit of Traits 611
Modern psychology emphasizes traits rather than types 611
Introverts and extraverts offer a continuum of personalities 612
How many personality traits are there? 614
Modern personality theory embraces the five-factor model 615
How do we assess personality traits? 617
Some tests are designed to screen for psychological disorders or career fit 620

© 2015 Sinauer Associates, Inc. This material cannot be copied, reproduced, manufactured or disseminated in any form without express written permission from the publisher.
Skeptic at Large: Can the MMPI Reliably Detect Malingering? 622

14.3 Biomedical Influences on Personality 624

There are genetic influences on personality traits 624
Temperament seems to be a lifelong characteristic 625
RESEARCHERS AT WORK: Tracking different temperaments 625
Is personality stable across situations? 627

14.4 Social Influences on Personality 629

Behaviorism: Behavioral approaches emphasize overt behavior and rewards 630
Cognitive psychology: Perceptions of control and competency shape a developing personality 630
Cross-cultural psychology studies the role of culture in personality 633

What Ever Happened to Phineas Gage? 634

THE CUTTING EDGE: Do Non-Human Animals Have Personalities? 636

Chapter 15
Social Psychology 641

The People’s Temple 641

15.1 Social Perception 643

Impressions and physical appearance affect social interactions 643
Attributions are easy to make and hard to shake 645
Psychology in Everyday Life: Inheriting Political Views 647
Different cultures foster different styles of attribution 648
Attitudes affect behavior, and behaviors affect attitude 649
Cognitive dissonance is the psychological discomfort of holding two conflicting beliefs 651
RESEARCHERS AT WORK: Getting paid to lie to others 651
Stereotypes and racial prejudice live on 654
Societal stereotypes are embedded deep in our brains 656
RESEARCHERS AT WORK: Implicit associations affect cognition 656
Stereotype threat produces self-fulfilling prophecies 658

15.2 Social Influences on Behavior 661

We constantly waver between conformity and nonconformity 661
Sometimes being part of a group leads us to shirk our responsibilities 666
Sometimes being part of a group leads us to do the wrong thing 667
Sometimes being part of a group leads us to make faulty decisions 667
What are the roles of cooperation and competition? 668
Evolutionary psychology offers an explanation for altruism 669
Neuroeconomics offers a new way of studying human influence 671

15.3 Friendship and Romance 673

Friends have things in common and reciprocate 673
Married people tend to be happier and healthier than single people 674
There are three components to romantic relationships 675

15.4 Aggression 676

Experiments in non-human animals offer a context for aggression 677
Hormones influence human aggression 678
Aggression can be planned or impulsive 679
Genes and the environment influence aggression 680
Social and cultural factors influence aggression 680
Skeptic at Large: Video Violence and Aggression 681
How can punishment reflect the crime and serve society? 682

15.5 Persuasion and Authority 684

Stanley Milgram demonstrated the power of authority 685
Later variations of Milgram’s experiment had surprising results 686
THE CUTTING EDGE: Aftermath of Milgram’s Study 688

© 2015 Sinauer Associates, Inc. This material cannot be copied, reproduced, manufactured or disseminated in any form without express written permission from the publisher.
16.1 Modern Classification of Psychological Disorders 694
Twentieth-century psychiatrists seeking standardization created the DSM 694
How do we define normal? 697
Modern classification emphasizes the consequences for everyday life 698
Mental disorders may represent extremes on a continuum 698

16.2 Anxiety Disorders, Obsessive-Compulsive Disorder, and Depression 700
What are the roots of anxiety disorders? 700
Phobias can be unlearned 701
Obsessive-compulsive disorder brings recurrent, unwanted thoughts and behaviors 702
Depression is a debilitating, potentially deadly disorder 704
Skeptic at Large: Does the Incidence of Depression Peak at the Holidays? 705
Cognitive behavioral therapy is as effective as antidepressant medication 706

16.3 Personality Disorders 708
Some personality disorders resemble mild versions of more serious disorders 708
Where are the borders for borderline personality disorder? 709
Avoidant personality disorder is characterized by social anxiety and feelings of inadequacy 710

16.4 Schizophrenia and Bipolar Disorder 713
Diagnosis and classification of schizophrenia suggest many different disorders 713
Anatomical differences are seen in the brains of many people with schizophrenia 714
There is a strong genetic component to schizophrenia 716
Schizophrenia is an inherited susceptibility to stress, especially stress early in life 717
RESEARCHERS AT WORK: The stress of city living 718
Antipsychotic medications revolutionized the treatment of schizophrenia 719
Despite popular portrayals, most people who develop schizophrenia recover appreciably 721
Several factors are associated with recovery from schizophrenia 722
Bipolar disorder is more like schizophrenia than depression 723
RESEARCHERS AT WORK: The entirely accidental discovery of lithium therapy 724
Are people with schizophrenia or bipolar disorder dangerous? 726
THE CUTTING EDGE: Scanning for Schizophrenia Risk 727
